

AJAX Contact Form Pro

USER GUIDE

V2.0

Last Updated
June 14, 2010

www.webprocomponents.com

1. Installation Guide

Just unzip and upload all the files to your server.

Requirements

PHP >= 5 (object oriented language features).

Be sure that the file **storage/messages.txt** is writeable by the PHP script. (755 attributes).

2. Front-end

It's really easy to integrate this component. The necessary html code is located in the file:

ContactFormPro.html

The front end works using the AJAX technology to provide a better user experience without page refreshes for the input validation, etc. However, if a user does not have javascript enabled (and in consequence AJAX is not available on his/her browser), the Ajax Form Contact Pro script will detect this fact and will still work. So, the user is not required to have javascript enabled.

3. Admin Panel

The backend is located in the file **Backend.html**

Once in the backend you will see the list of messages that you have received sorted by date/time in descending order.

To reply to a message you need to click on the "Read/Reply" option at the right side of the message list. Once you click that link you will see the full message details and a box where you can enter the answer. By pressing the "Send Message" button the message will be sent to the email address the user specified in his original message. You can also cancel the reply by pressing on the "Cancel" button.

To delete a message you can click on the "Delete" link at the right side of the message table.

It's important to note that all the "action" is happening behind thanks to the AJAX technice. You won't see page refreshes. We've combined all the AJAX background communications with the nice JQuery visual effects to provide a smooth UI.

4. Configuration

To customize the script to your website needs, you will need to edit the configuration file:

WebPro_ContactFormPro_Configuration.php

That's all!

IMPORTANT: Don't forget to include the **CSS/JS** files.
